The ID & IL series are dent resistant and easy to clean with a simple soap and water solution. Made of approximately 90% wood fibers and 10% resin to hold it together, MDF maximizes the use of our forest resources by utilizing the residual wood element of forests not used in producing lumber, which could have otherwise ended up in landfills.

# impressions collection | 2 series

The Impressions collection features thermofoil doors which are made using a flexible vinyl material that is applied by heating the vinyl and molding it over medium-density fiberboard (MDF). It has a flawless, silky-smooth surface that resists chipping better than painted surfaces.

If you are searching for reasonably-priced kitchen cabinets with little maintenance required, do not hesitate to select thermofoil kitchen cabinets.

Advantages of thermofoil cabinets:

- easy care and low maintenance
  - the laminate surface resists stains and is easily wiped down. Stubborn residues such as grease can be removed with a mild all-purpose cleaner. Thermofoil doesn't require protective coatings, as wooden cabinets do, which means they need less maintenance.
- uniform look from door to door,
  - this kind of cabinet door is the best substitute for solid wood.
- design and color versatility
  - a major advantage of thermofoil cabinets is their wide range of color and pattern options. The vinyl surface of these cabinets may be molded into a variety of patterns and shapes, which allows you the choice of a basic flat cabinet, or one with an embellished design; you also have the option of matte or glossy finishes.

The Impressions collection includes two series:

- il
- id
